

**PYRIDINE COMPOUNDS AS INHIBITORS OF DIPEPTIDYL PEPTIDASE IV****Technical Field**

The present invention relates to a pyridine compound  
5 having a peptidase inhibitory activity, which is useful as an  
agent for the prophylaxis or treatment of diabetes and the  
like.

**Background Art**

Peptidase is known to relate to various diseases.  
10 Dipeptidyl dipeptidase-IV (hereinafter sometimes to be  
abbreviated as DPP-IV), which is one kind of peptidases, is  
serine protease that specifically binds with a peptide  
containing proline (or alanine) at the 2nd from the N-terminal  
and cleaves the C-terminal side of the proline (or alanine) to  
15 produce dipeptide. DPP-IV has been shown to be the same  
molecule as CD26, and reported to be also involved in the  
immune system. While the role of DPP-IV in mammals has not  
been entirely clarified, it is considered to play an important  
role in the metabolism of neuropeptides, activation of T cells,  
20 adhesion of cancerous cells to endothelial cells, invasion of  
HIV into cells and the like. Particularly, from the aspect of  
glycometabolism, DPP-IV is involved in the inactivation of GLP-  
1 (glucagon-like peptide-1) and GIP (Gastric inhibitory  
peptide/Glucose-dependent insulintropic peptide), which are  
25 incretins. With regard to GLP-1, moreover, it is known that  
the physiological activity of GLP-1 is markedly impaired  
because it has a short plasma half-life of 1-2 minutes, and  
GLP-1(9-36)amide, which is a degradation product by DPP-IV,  
acts on GLP-1 receptor as an antagonist, thus decomposing GLP-1  
30 by DPP-IV. It is also known that suppression of degradation of  
GLP-1 by inhibiting DPP-IV activity leads to potentiation of  
physiological activity that GLP-1 shows, such as glucose  
concentration-dependent insulin secretagogue effect and the  
like. From these facts, a compound having a DPP-IV inhibitory

activity is expected to show effect on impaired glucose tolerance, postprandial hyperglycemia and fasting hyperglycemia observed in type I and type II diabetes and the like, obesity or diabetic complications associated therewith and the like.

5 hypertriglyceridemia, hypercholesteremia, hypoHDLemia, postprandial hyperlipidemia etc.).

The compound of the present invention is useful as an agent for the prophylaxis or treatment of diabetes (e.g., type 1 diabetes, type 2 diabetes, gestational diabetes and the  
10 like); an agent for the prophylaxis or treatment of hyperlipidemia (e.g., hypertriglyceridemia, hypercholesterolemia, hypoHDLemia, postprandial hyperlipidemia and the like); an agent for the prophylaxis or treatment of arteriosclerosis; an agent for the prophylaxis or treatment of  
15 impaired glucose tolerance [IGT]; an insulin secretagogue; and an agent for preventing progress of impaired glucose tolerance into diabetes.

For diagnostic criteria of diabetes, Japan Diabetes Society reported new diagnostic criteria in 1999.

20 According to this report, diabetes is a condition showing any of a fasting blood glucose level (glucose concentration of intravenous plasma) of not less than 126 mg/dl, a 75 g oral glucose tolerance test (75 g OGTT) 2 h level (glucose concentration of intravenous plasma) of not less than  
25 200 mg/dl, and a non-fasting blood glucose level (glucose concentration of intravenous plasma) of not less than 200 mg/dl. A condition not falling under the above-mentioned diabetes and different from "a condition showing a fasting blood glucose level (glucose concentration of intravenous  
30 plasma) of less than 110 mg/dl or a 75 g oral glucose tolerance test (75 g OGTT) 2 h level (glucose concentration of intravenous plasma) of less than 140 mg/dl" (normal type) is called a "borderline type".

In addition, ADA (American Diabetes Association)

reported new diagnostic criteria of diabetes in 1997 and WHO in 1998.

According to these reports, diabetes is a condition showing a fasting blood glucose level (glucose concentration of intravenous plasma) of not less than 126 mg/dl and a 75 g oral glucose tolerance test 2 h level (glucose concentration of intravenous plasma) of not less than 200 mg/dl.

According to the above-mentioned reports, impaired glucose tolerance is a condition showing a fasting blood glucose level (glucose concentration of intravenous plasma) of less than 126 mg/dl and a 75 g oral glucose tolerance test 2 h level (glucose concentration of intravenous plasma) of not less than 140 mg/dl and less than 200 mg/dl. According to the report of ADA, a condition showing a fasting blood glucose level (glucose concentration of intravenous plasma) of not less than 110 mg/dl and less than 126 mg/dl is called IFG (Impaired Fasting Glucose). According to the report of WHO, among the IFG (Impaired Fasting Glucose), a condition showing a 75g oral glucose tolerance test 2 h level (glucose concentration of intravenous plasma) of less than 140 mg/dl is called IFG (Impaired Fasting Glycemia).

The compound of the present invention can be also used as an agent for the prophylaxis or treatment of diabetes, borderline type, impaired glucose tolerance, IFG (Impaired Fasting Glucose) and IFG (Impaired Fasting Glycemia), as determined according to the above-mentioned new diagnostic criteria. Moreover, the compound of the present invention can prevent progress of borderline type, impaired glucose tolerance, IFG (Impaired Fasting Glucose) or IFG (Impaired Fasting Glycemia) into diabetes.

Upon producing the compound of the present invention,

when the starting compound has amino group, carboxyl group, hydroxy group or carbonyl group as a substituent, a protecting group generally used in peptide chemistry and the like may be introduced into these groups. By removing the protecting group

When the starting compound can form a salt upon producing the compound of the present invention, the compound  
30 in the form of a salt may be used. As such salt, those exemplarily recited above for the salt of compound (I) can be used.

When compound (I) contains an optical isomer, a stereoisomer, a positional isomer or a rotational isomer, these

are also encompassed in compound (I), and can be obtained as a single product according to a synthetic method and separation method known *per se*. For example, when compound (I) has an optical isomer, an optical isomer resolved from this compound  
5 is also encompassed in compound (I).

The optical isomer can be produced by a method known *per se*. To be specific, an optically active synthetic intermediate is used, or the final racemate product is subjected to optical resolution according to a conventional method to give an  
10 optical isomer.

The method of optical resolution may be a method known *per se*, such as a fractional recrystallization method, a chiral column method, a diastereomer method and the like.

#### 1) Fractional recrystallization method

15 A salt of a racemate with an optically active compound (e.g., (+)-mandelic acid, (-)-mandelic acid, (+)-tartaric acid, (-)-tartaric acid, (+)-1-phenethylamine, (-)-1-phenethylamine, cinchonine, (-)-cinchonidine, brucine and the like) is formed, which is separated by a fractional recrystallization method,  
20 and a free optical isomer is obtained by a neutralization step where desired.

#### 2) Chiral column method

A racemate or a salt thereof is applied to a column for separation of an optical isomer (chiral column) to allow  
25 separation. In the case of a liquid chromatography, for example, a mixture of an optical isomer is applied to a chiral column such as ENANTIO-OVM (manufactured by Tosoh Corporation) or CHIRAL series (manufactured by Daicel Chemical Industries, Ltd.) and the like, and developed with water, various buffers  
30 (e.g., phosphate buffer) and organic solvents (e.g., ethanol, methanol, isopropanol, acetonitrile, trifluoroacetic acid, diethylamine and the like) solely or in admixture to separate the optical isomer. In the case of a gas chromatography, for example, a chiral column such as CP-Chirasil-DeX CB

(manufactured by GL Sciences Inc.) and the like is used to allow separation.

### 3) Diastereomer method

A racemic mixture is prepared into a diastereomeric  
5 mixture by chemical reaction with an optically active reagent,  
which is prepared into a single substance by a typical  
separation means (e.g., fractional recrystallization,  
chromatography method and the like) and the like, and subjected  
to a chemical treatment such as hydrolysis and the like to  
10 separate an optically active reagent moiety, whereby an optical  
isomer is obtained. For example, when compound (I) contains  
hydroxy group or primary or secondary amino group in a  
molecule, the compound and an optically active organic acid  
(e.g., MTPA [ $\alpha$ -methoxy- $\alpha$ -(trifluoromethyl)phenylacetic acid],  
15 (-)-menthoxyacetic acid and the like) and the like are  
subjected to condensation reaction to give an ester form  
diastereomer or amide form diastereomer, respectively. When  
compound (I) has a carboxyl group, this compound and an  
optically active amine or an optically alcohol reagent are  
20 subjected to condensation reaction to give an amide form  
diastereomer or ester form diastereomer, respectively. The  
separated diastereomer is converted to an optical isomer of the  
original compound by acidic hydrolysis or basic hydrolysis  
reaction.

25 The compound (I) may be in the form of a crystal.

The crystal of compound (I) (hereinafter sometimes to be  
referred to as crystal of the present invention) can be  
produced by crystallization of compound (I) by a  
crystallization method known per se.

30 Examples of the crystallization method include  
crystallization from a solution, crystallization from vapor,  
crystallization from a molten form and the like.

The "crystallization from a solution" is typically a  
method including shifting a non-saturated state to

supersaturated state by varying factors involved in solubility of compounds (solvent composition, pH, temperature, ionic strength, redox state etc.) or the amount of solvent. To be specific, for example, concentration method, annealing method, 5 reaction method (diffusion method, electrolysis method), hydrothermal growth method, fusing agent method and the like can be mentioned. Examples of the solvent to be used include aromatic hydrocarbons (e.g., benzene, toluene, xylene etc.), halogenated hydrocarbons (e.g., dichloromethane, chloroform 10 etc.), saturated hydrocarbons (e.g., hexane, heptane, cyclohexane etc.), ethers (e.g., diethyl ether, diisopropyl ether, tetrahydrofuran, dioxane etc.), nitriles (e.g., acetonitrile etc.), ketones (e.g., acetone etc.), sulfoxides (e.g., dimethyl sulfoxide etc.), acid amides (e.g., N,N- 15 dimethylformamide and the like), esters (e.g., ethyl acetate etc.), alcohols (e.g., methanol, ethanol, isopropyl alcohol etc.), water and the like. These solvents are used alone or in combination of two or more at a suitable ratio (e.g., 1:1 to 1:100 (volume ratio)).

20 The "crystallization from vapor" is, for example, vaporization method (sealed tube method, gas stream method), gas phase reaction method, chemical transportation method and the like.

The "crystallization from a molten form" is, for 25 example, normal freezing method (Czochralski method, temperature gradient method, Bridgman method), zone melting method (zone leveling method, floating zone method), special growth method (VLS method, liquid phase epitaxy method) and the like.

30 Preferable examples of the crystallization method include a method including dissolving compound (I) in a suitable solvent (e.g., alcohols such as methanol, ethanol etc., and the like) at a temperature of 20 to 120°C and cooling the resulting solution to a temperature not higher than the

temperature of dissolution (e.g., 0 to 50°C, preferably 0 to 20°C) and the like.

The thus-obtained crystals of the present invention can be isolated by, for example, filtration and the like.

5 In the present specification, the melting point refers to that measured using, for example, micromelting point measuring apparatus (Yanako, MP-500D or Buchi, B-545) or DSC (differential scanning calorimetry) device (SEIKO, EXSTAR6000) and the like.

10 In general, melting points vary depending on measurement apparatuses, measurement conditions and the like. The crystal in the present specification may show a different melting point described in the present specification, as long as it is within general error range.

15 The crystal of the present invention is superior in physicochemical properties (e.g., melting point, solubility, stability etc.) and biological properties (e.g., pharmacokinetics (absorption, distribution, metabolism, excretion), efficacy expression etc.), and is extremely useful  
20 as a pharmaceutical agent.

To a solution of tert-butyl {[5-amino-2-isobutyl-6-methyl-4-(4-methylphenyl)pyridin-3-yl]methyl}carbamate (383 mg, 1.0 mmol) in tetrahydrofuran (5 mL) was added 3-cyanobenzoyl chloride (245 mg, 1.5 mmol) and triethylamine (280  $\mu$ L, 2.0 mmol) was added. The mixture was stirred for 18 hrs. Saturated aqueous sodium hydrogen carbonate solution (5 mL) was added to the reaction mixture and the mixture was extracted with ethyl acetate. The organic layer was washed with saturated brine and dried over anhydrous magnesium sulfate. The solvent was evaporated under reduced pressure and the obtained residue was purified by silica gel column chromatography to give an oil. To a solution of the obtained oil in ethanol (5 mL) was added hydroxylamine hydrochloride (192 mg, 3.0 mmol) and sodium carbonate (420 mg, 4.0 mmol) and the mixture was stirred at 80°C for 15 hrs. Distilled water (10 mL) was added to the reaction mixture and the mixture was extracted with ethyl acetate. The organic layer was washed with saturated brine and dried over anhydrous magnesium sulfate. The solvent was evaporated under reduced pressure to give an oil. To a solution of the obtained oil in tetrahydrofuran (3 mL) was added N,N'-carbonyldiimidazole (324 mg, 2.0 mmol) and the mixture was stirred at 65°C for 2 hrs. Saturated aqueous sodium carbonate solution (5 mL) was added to the reaction mixture and the mixture was extracted with ethyl acetate. The organic layer was washed with saturated brine and dried over anhydrous magnesium sulfate. The solvent was evaporated under reduced pressure and the obtained residue was purified by silica gel column chromatography to give an oil.

To a solution of the obtained oil in ethyl acetate (2 mL) was added 4N hydrogen chloride ethyl acetate solution (2 mL) and the mixture was stirred at room temperature for 3 hrs. The solvent was evaporated under reduced pressure and the obtained

#### 15 **Experimental Example 1**

Determination of dipeptidyl peptidase IV inhibitory activity in rat plasma

The reaction was carried out according to the method of Raymond et al. (Diabetes, vol. 47, pp. 1253-1258, 1998) using a  
20 96 well flat-bottomed plate at 30°C. An N,N-dimethylformamide solution (1  $\mu\text{L}$ ) containing the test compound was added to a mixture of water (69  $\mu\text{L}$ ), 1 M Tris-hydrochloride buffer (10  $\mu\text{L}$ , pH 7.5) and 1 mM aqueous Gly-Pro-p-NA solution (100  $\mu\text{L}$ ) to prepare a mixed solution. Plasma (20  $\mu\text{L}$ ) prepared from blood  
25 of SD rat by a conventional method was added to the above-mentioned mixed solution and the enzyme reaction was started at 30°C. The absorbance after 0 hr. and 1 hr. was measured using a microplate reader at a wavelength of 405 nm and an increase ( $\Delta\text{ODs}$ ) was determined. At the same time, an increase ( $\Delta\text{ODc}$ ) in  
30 absorbance of the reaction mixture without the test compound, and an increase ( $\Delta\text{ODb}$ ) in absorbance of the reaction mixture without the test compound and the enzyme were determined and percent inhibition of dipeptidyl peptidase IV enzyme activity was calculated from the following formula:

$$\{1 - [(\Delta\text{ODs} - \Delta\text{ODb}) / (\Delta\text{ODc} - \Delta\text{ODb})]\} \times 100$$

The dipeptidyl peptidase IV inhibitory activity of the  
 5 test compound group is expressed in IC<sub>50</sub> value (nM) and shown  
 in Table 5.

Table 5

Test compound (Example No.)	IC <sub>50</sub> value (nM)
1	520

 has a superior dipeptidyl peptidase IV inhibitory activity, and  
 is useful as an agent for the prophylaxis or treatment of  
 diabetes and the like.
